AB - J60065032 Process comprises stacking a desired number of sheet moulding cpds. (SMC) contg. 5-40wt.% Al fibre and 5-40wt.% glass fibre, and stacking SMC with 1.0-3.5 kg/m², which does not contain Al fibre on the upper and lower surfaces of the stacked SMC, and moulding the stacked prod.

- As the matrix, thermosetting resin such as unsatd. polyester, vinylester resin, epoxy resin, phenol resin, melamine resin, etc. is pref. As the Al fibre, Al fibre with non-smooth surface, which is mfd. by vibration cutting is pref. The Al fibre pref. has length 2.5-25 mm and thickness 10-200 microns. Total content of Al fibre and glass fibre is pref. 10-60(15-50)wt.%.
- USE/ADVANTAGE - Composite is easily handled and has good moulding properties. The obtd. moulding has excellent heat resistance and toughness, has insulating surface and high electroconductivity and electromagnetic shielding property. As it does not need sec. processing, it is economical and useful for housing various electronic machinery and tools.(0/0)
